Fullstack Engineer with over a year of experience, most recently at Grab building internal finance and ledger platforms used daily by engineering, operations, and finance teams. Owned features end-to-end, from database schema and Go/gRPC services (MySQL, Redis) to React/TypeScript interfaces and tests, and set up CI/CD pipelines for both frontend and backend.

WORK EXPERIENCE

Software Engineer (Contract) **Dec 2025 - Jun 2026**
Grab **Ho Chi Minh City**

Zen Ledger Portal (React, TypeScript, Go, gRPC, MySQL, Redis, Kubernetes)

- Delivered account and transaction workflows end-to-end across React and Go/gRPC services, including listing, search, URL-synced filtering, detail views, account creation, and balance updates, used daily by ledger engineering and operations teams.
- Implemented server-side pagination in the Go APIs and virtualized list rendering with TanStack Virtual on the frontend.
- Built a balance view with toggleable 5-second auto-refresh, letting operations users monitor balance changes without reloading the page.
- Contributed to database schema design, wrote MySQL queries for account and transaction features, and cached user info in Redis at login to avoid repeated lookups.
- Set up CI/CD pipelines for both frontend and backend repositories, and troubleshot a failed Kubernetes deployment caused by a security group misconfiguration that blocked load balancer health checks.
- Wrote unit and UAT tests across frontend and backend to catch regressions before release.

Software Engineer Intern **Jul 2025 - Dec 2025**
Grab **Ho Chi Minh City**

Invoicing Portal (React, TypeScript, Go, MySQL, Superset, Kibana, Datadog)

- Onboarded the portal onto Console, the company's micro-frontend hub for internal tools, keeping it working both inside Console and as a standalone app; resolved authentication and styling issues, including a permission-loading bug fixed by building a Go API that looks up user permissions from the centralized OIDC service.
- Proposed and built Billing Rule Schedule to run billing rules automatically with preset parameters; 100% of rules whose schedules were previously kept only as notes now run on schedule, so teams such as Grab for Business no longer trigger them by hand or miss billing runs.
- Moved schedules from free-form JSON metadata into a dedicated table (multiple timezone-aware cron schedules per rule, each with its own parameters, indexed by next_run_at), validated required template parameters at configuration time, and added locking to prevent concurrent worker instances from triggering the same run.
- Built bulk download of billing calculation reports (BCR) across multiple invoices, replacing the previous one-by-one download from each invoice page.
- Handled on-call issues, querying the data warehouse via Superset to trace invoice and receipt data discrepancies back to upstream systems.

Universal Configuration Management (React, TypeScript, Ant Design, TanStack Query, Zod, Storybook)

- Built the frontend for config change requests on the platform engineers across Grab use to manage backend service configs such as feature flags and Vault secret paths, including a Monaco-based editor with a diff view for reviewing changes.
- Built a request status view that tracks each change's GitLab merge request from automated checks through approval to deployment, with deploy actions via GitLab or Conveyor (the internal EKS deployment platform) pre-filled from URL parameters.
- Designed a Zod-based service layer that validates API responses and maps them to separate frontend schemas, isolating the UI from backend contract changes.
- Built reusable Editor, Tree, and Table components using the compound component pattern on top of Ant Design, documented in Storybook and covered by unit tests.

Frontend Developer Intern **Dec 2024 - Mar 2025**
TMA Solutions **Ho Chi Minh City**

Voucher Management System (Next.js, Material UI, Tailwind CSS)

- Built an admin dashboard for monitoring voucher usage, with filtering and error-log tracking to help admins spot operational issues.
- Used server-side rendering with the Next.js App Router for initial page loads, cached data with React Query, and debounced filter inputs to reduce redundant API calls.

PROJECTS

Cloud-Native E-Commerce Platform – Capstone, team of 2 (.NET, RabbitMQ, gRPC, AWS, Terraform, React, Nx) **Jan 2026 - Mar 2026**

- Built the Basket and Discount microservices in .NET, with synchronous gRPC calls from basket to discount for pricing, and published checkout events to RabbitMQ via MassTransit for asynchronous order processing.
- Built the React micro-frontends (host and remotes) with Nx and Module Federation, and wrote a Terraform module that serves them from S3 through CloudFront, using immutable versioned remote builds and an uncached manifest for instant promotion and rollback.
- Wrote Terraform modules for container registries (ECR with image scanning and lifecycle cleanup) and centralized logging (OpenSearch inside the VPC, encrypted at rest and in transit).

SKILLS

Languages: TypeScript, JavaScript, Go, SQL, HTML/CSS

Frontend: React, Next.js, TanStack Query/Router/Virtual, Zustand, Zod, Ant Design, Tailwind CSS, Storybook

Backend: gRPC, REST APIs, MySQL, Redis, RabbitMQ

Architecture: Microservices, Micro-frontends (Module Federation, Nx)

DevOps & Tooling: Docker, GitHub Actions, GitLab CI/CD, Webpack, AWS (S3, CloudFront, ECR), Terraform

Testing & Observability: Jest, React Testing Library, Go testing, Datadog, Kibana

AI Tools: Claude Code, Cursor

EDUCATION

Bachelor of Software Engineering **Sep 2022 - Mar 2026**

University of Information Technology (UIT – VNU-HCM) **GPA:** 8.57/10

LANGUAGES

English (Professional working proficiency)

CERTIFICATIONS

TOEIC Speaking & Writing (Score: 280) by **ETS** **Jan 2026**

TOEIC Reading & Listening (Score: 745) by **ETS** **Sep 2024**
